

Hey bro, I've been thinking deeply about the direction of the agricultural web app and I want us to simplify the MVP first before trying to build a full e-commerce platform.

Instead of handling direct buying/selling and payments immediately, I want the platform to work more like a connection marketplace where buyers post what they need and sellers/farmers can find them and contact them directly.

The main goal of version 1 is:

Core Concept

- Buyers register and post agricultural demands.
- Sellers/farmers browse those demands.
- Sellers contact buyers directly through phone number or contact info.
- No payment integration for now.
- No delivery/logistics system for now.
- The platform is mainly for connecting people in agriculture.

Example

A buyer can post:

- Need 500 bags of maize
- Looking for tomato suppliers in Abuja
- Need weekly poultry feed supply

The post should contain:

- Product name
- Quantity needed

- Location
- Budget/price range (optional)
- Description
- Contact phone number
- Date posted

User Types

1. Buyers

- Can create account
- Can create demand posts
- Can edit/delete their posts
- Can upload product images if needed

2. Sellers/Farmers

- Can create account
- Can browse buyer requests
- Can search/filter by:
 - product
 - state/location
 - quantity
- Can view buyer contact details

Main Features for MVP

- User authentication/login/signup

- Buyer demand posting
- Search and filtering system
- User profiles
- Contact display
- Admin dashboard
- Post moderation/report system
- Basic verification badge system later

Admin Side

Admin should be able to:

- Approve/remove fake posts
- Ban users
- Monitor listings
- Manage categories

Future Plans (not for MVP yet)

Later we can add:

- In-app messaging
- Online payments
- Escrow system
- Delivery/logistics integration
- Subscription plans
- Verified supplier badges

- Commodity price tracking
- Analytics/dashboard

Important

I want the UI to feel:

- simple
- modern
- fast
- easy for farmers and buyers to use
- mobile friendly first

The idea is to start lean, solve the connection problem first, and scale gradually instead of trying to build everything at once.
